The Eisenhower Matrix and Your MVP

	Urgent	Not Urgent
Important	DO - (Your MVP) 1. Fetch live daily menu JSON data from the Purdue Dining API using Python's requests library. 2. Parse the JSON response to extract dining halls, stations, and dish names. 3. Implement a rule-based dietary/allergen filter script to screen out restricted items (e.g., specific meats or allergens). 4. Output filtered, safe menu options clearly formatted as text in the terminal.	SCHEDULE — (For V2.0+) 1. Add local user profile storage to save favorite dining halls and custom dietary restrictions. 2. Integrate macro-nutrients (calories and protein) tracking for fitness-oriented students. 3. Build a "what can I make with available ingredients" recipe suggestion engine. 4. Implement a community dish rating and review system. 5. Transition the backend logic into a mobile app (iOS/Android) for the App Store.
Not Important	DELEGATE — (Use a library) 1. Use Python's built-in `requests` library for HTTP networking instead of writing a custom HTTP client. 2. Use Python's built-in	DELETE — (Cut it) 1. Real-time push notifications for sudden menu changes. 2. Machine learning-based

	`json` library for parsing JSON data instead of writing a manual parser. 3. Use local JSON files for data storage instead of building a full SQL database.	automated dietary preference prediction. 3. Social media sharing features and community feeds.
